## 1.0 INTRODUCTION

On behalf of the Connecticut Department of Transportation (ConnDOT), Maguire Group Inc. (MGI) has completed a Task 210 - Subsurface Site Investigation for the 163 Connecticut Avenue property in Norwalk, Connecticut. The Task 210 investigation was completed in association with the Safety Improvements to Interstate 95 Southbound between Interchanges 15 & 14 in Norwalk, Connecticut. The project involves the construction of an auxiliary lane for approximately 701 meters (2,300 feet) between the Interstate 95 (I-95) Southbound Interchange 15 on-ramp from Route 7, to the Interchange 14 off-ramp to Route 1. The auxiliary lane will expand into two lanes for the Exit 14 off-ramp to Route 1. These two lanes exiting I-95 will then expand into three lanes at the junction with Route 1. There will be two left-turn lanes and one right-turn lane to provide storage and improve traffic operations. Route 1 will be widened to accommodate 2.1 meter (7 foot) sidewalks on both sides of the roadway, and a lengthened left turn lane from Route 1 to the I-95 Southbound on-ramp.

Also proposed are traffic and safety improvements for the Cedar Street intersection with Route 1. Cedar Street will be realigned to intersect Route 1 opposite Ferris Street. The traffic signal will be upgraded and left-turn lanes will be constructed for each approach onto Route 1. Route 1 will also be widened in this area. The Taylor Avenue, Cedar Street, and Fairfield Avenue bridges will also be widened. A new abutment on the I-95 Southbound side and a new superstructure will be provided for these bridges to accommodate the auxiliary lane on I-95 Southbound.

Based upon a review of the proposed construction plans, it is anticipated that the project will involve rights-of-way taking, cut and fill activities, drainage structure improvements, and utility realignments. The anticipated construction activities will involve the total right-of-way taking of the 163 Connecticut Avenue property. Therefore, this Task 210 – Subsurface Site Investigation was conducted on the 163 Connecticut Avenue property. Figure 1 depicts the project area.

**FIGURE 1 – SITE LOCATION PLAN**

**Safety Improvements to Interstate 95 Southbound Between Interchanges 15 & 14**  
**163 Connecticut Avenue - Norwalk, Connecticut**

The purpose of the Task 210 - Subsurface Site Investigation is to verify the absence or presence and location of subsurface contamination within the 163 Connecticut Avenue property boundaries. A Task 910 estimate of remedial cost may also be prepared for this parcel if warranted by the results of the Task 210.

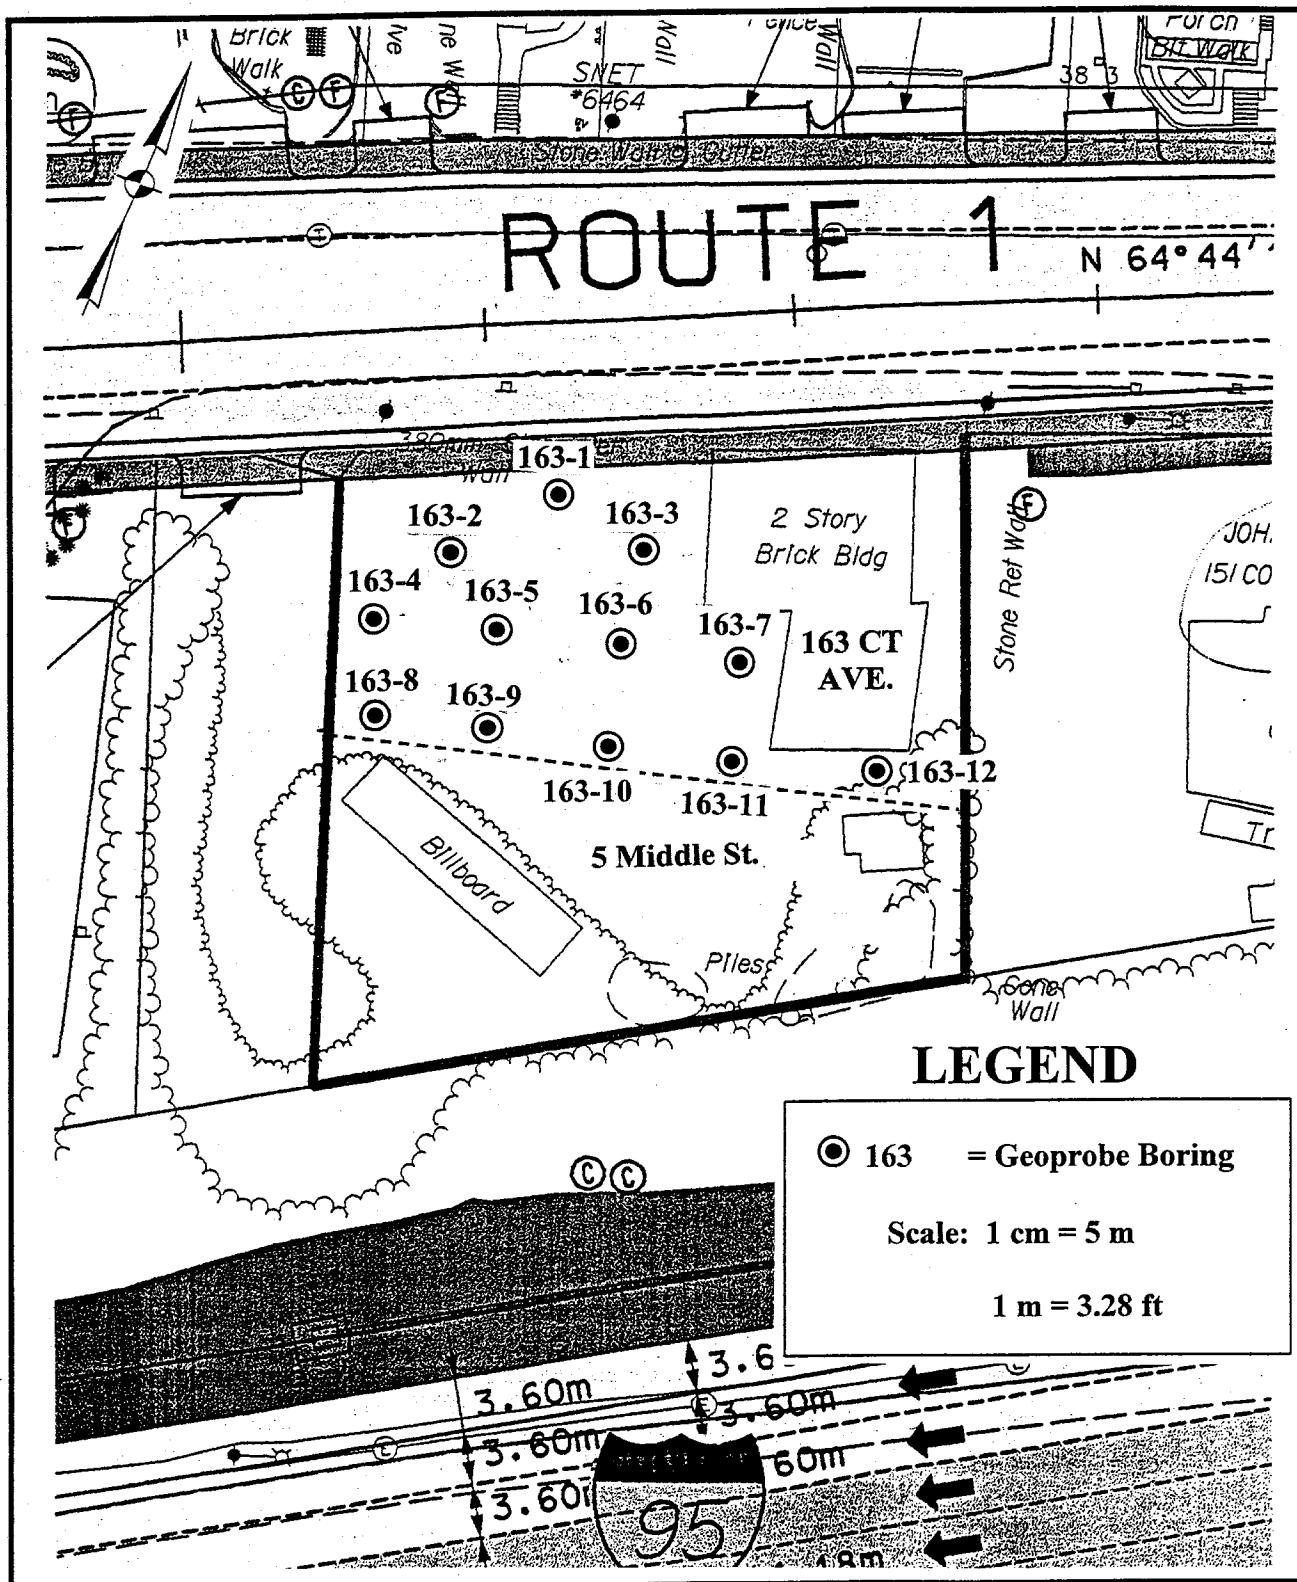

## **2.0     SITE DESCRIPTION**

The Task 210 - Subsurface Site Investigation was conducted on the 163 Connecticut Avenue property, which consists of an approximate 0.126 hectare (0.28 acre) lot that contains a multi-family residence. Attached to the rear of the residence is a two-bay, concrete block garage that houses Norwalk Taxi. The property formerly housed an automotive, boat and recreational vehicle sales and service business from the 1970's to the 1990's. The property is currently owned by Fairmead Real Estate Associates, LLC, and was assigned a high risk designation in MGI's July, 2002 Task 110 – Corridor Land Use Evaluation report. The site is depicted in Figure 2 - Task 210 Project Area & Sampling Locations.

## **3.0     LOCAL ENVIRONMENT & RECEPTORS**

### **3.1     Groundwater**

According to the Connecticut Department of Environmental Protection (CTDEP) 1985 Adopted Water Quality Classifications for the Southwest Coast River Basin, the groundwater classification for the project area is "GB". A "GB" groundwater classification indicates that the groundwater may not be suitable for direct human consumption without the need for treatment due to waste discharges, spills or leaks of chemicals, or land use impacts. The 163 Connecticut Avenue property is connected to the public water distribution system and municipal sewer system. The general topography of the site slopes downward to the north. Based upon the site setting, the inferred direction of groundwater flow is towards the east/southeast, towards Norwalk Harbor. Groundwater was not encountered in any of the borings advanced during this investigation.

**FIGURE 2 - Task 210 Project Area & Sampling Locations**  
**Safety Improvements to Interstate 95 Southbound Between Interchanges 15 & 14**  
**163 Connecticut Avenue**  
**Norwalk, Connecticut**

### **3.2    Surface Water**

The project area is located within the Norwalk Regional Basin, within the Southwest Coast Major Drainage Basin. There are no surface water bodies on or adjacent to the 163 Connecticut Avenue property.

### **3.3    Geology**

The Surficial Materials Map of Connecticut depicts the surficial geology of the project area as brown sandy soils with a friable, loamy substratum, and shallow sandy soils over bedrock. The Bedrock Geological Map of Connecticut, compiled by John Rodgers in 1985, indicates that the bedrock unit underlying the project area is the Trap Falls Formation, which is a gray medium-grained schist and a light-colored, foliated, granitic gneiss.

Sampler refusal on a gray, granitic gneiss unit was encountered in nearly all of the borings at depths ranging from 0.6 to 1.8 meters (2 to 6 feet) below grade. Soil encountered during the investigation indicated that the soil underlying the project area consists mainly of brown silt units with varying amounts of sand, gravel, and cobbles.

## **4.0    SUBSURFACE INVESTIGATION**

Based upon the former industrial and commercial nature of the 163 Connecticut Avenue property, a comprehensive sampling program was conducted on the parcel. The following subsections detail the investigation.

#### **4.1 Geoprobe® Soil Borings & Soil Sample Analyses**

On May 5, 2003, twelve (12) soil borings (163-1 to 163-12) were advanced throughout the 163 Connecticut Avenue property. The entire property was investigated because a full right-of-way property take is proposed for the parcel. Permission to access the property was obtained from the State of Connecticut by means of a Notice of Condemnation dated March 25, 2003. The Geoprobe® borings were advanced by Logical Environmental Solutions, under the direction of Maguire Group Inc. The locations of the Geoprobe® soil borings are depicted on Figure 2 – Task 210 Project Area & Sampling Locations.

The Geoprobe® soil borings were advanced to a depth of 3.7 meters (12 feet) below grade, or refusal. Continuous soil samples were collected utilizing a 1.2 meter (4-foot) long, 5 centimeter (2-inch) diameter Macro Core Sampler with dedicated acetate liners. The soil samples were visually inspected in the field for staining, and described as to physical characteristics and soil type. In addition, the soil samples were screened in the field for total volatile organic compounds utilizing a Photovac photoionization detector (PID). Soil boring logs were generated in the field by Maguire field personnel. The boring logs denote the types of soil encountered, the depth to groundwater and/or bedrock, the total depth reached in each boring, and the highest observed PID reading. Copies of the boring logs are included at the end of this report in Appendix A.

Based upon field screening results and visual observations, one soil sample from each boring was placed in glassware supplied by Spectrum Analytical Laboratory, and stored in an ice-filled cooler. The analyses for each soil sample included volatile organic compounds (VOCs) utilizing EPA Method 8260, total petroleum hydrocarbons utilizing the Connecticut Extractable Petroleum Hydrocarbon Method (CT ETPH), polynuclear aromatic hydrocarbons (PAHs) utilizing EPA Method 8270, total RCRA 8 metals, and SPLP RCRA 8 metals.

All Geoprobe® soil borings were back-filled and patched upon completion utilizing clean sand and/or hydrated bentonite. All down-hole sampling equipment was decontaminated in accordance with Maguire's January 2003 Task 210 - Subsurface Site Investigation Work Plan.

#### **4.2 Project Quality Assurance/Quality Control Practices**

To assess the collection of samples in the field in terms of the sampling techniques and decontamination procedures followed, quality control and quality assurance samples were collected. One field blank sample was collected in the field and one trip blank water sample was prepared by Spectrum Analytical Laboratory. The field blank sample was prepared by pouring laboratory supplied de-ionized water through an acetate liner and macro core cutting shoe, and collecting the resulting rinsate in appropriate sample containers. The trip blank and field blank samples were stored with the daily samples in the sample cooler until subsequent delivery to the laboratory for analysis. The field blank was analyzed for the same parameters specified for the daily samples. The trip blank was analyzed for volatile organic compounds.

All samples collected in the field were stored in a manner that preserved the integrity of the sample chemistry. Samples intended for organic analyses were stored in an ice-filled cooler until delivery to the laboratory. Chain-of-Custody (COC) forms were filled out and accompanied all samples collected as a legal record of possession of the sample. The COC was initiated in the field and accompanied the containers during sample collection, transportation to the lab, analysis, and final disposal of the sample. All sampling equipment was either dedicated to a specific sample or was decontaminated prior to and between each use. Sampling equipment was not placed near solvents, gasoline, or materials that may have impacted the integrity of the samples.

## 5.0 DISCUSSION OF SAMPLE RESULTS

### 5.1 Regulatory Criteria

The CTDEP adopted Remediation Standard Regulations (Regulations of Connecticut State Agencies, Section 22a-133k-1 to 3 and 22a-133q-1) as of January 31, 1996. The Remediation Standard Regulations (RSRs) apply to any site undergoing voluntary remediation under Public Acts 95-183 or 95-190, a transfer of an “establishment” under Public Act 95-183, or any site as ordered by the CTDEP Commissioner. The Regulations also outline the processes for establishing alternative site-specific numerical standards for certain sites, upon approval by the CTDEP.

The RSRs criteria applicable to the soil and groundwater sampled during this investigation are summarized below. The application of these RSRs to the results of the laboratory analyses from this investigation is discussed in subsection 5.2.

**Soils Criteria:** The RSRs are organized into two sets of criteria: the Direct Exposure Criteria (DEC) and the Pollutant Mobility Criteria (PMC). The DEC and PMC are briefly explained in the following sub-sections, in relation to how they would be applicable to the types of analyses conducted on the soil samples collected for this investigation. Please refer to the RSRs for a complete explanation of the Regulations.

#### Direct Exposure Criteria

The purpose of the Direct Exposure Criteria (DEC) is to protect human health from risks associated with the direct contact with or ingestion of various common soil contaminants. The DEC are applicable to soil within approximately 4.6 meters (15 feet) of the ground surface. Concentrations of contaminants are evaluated based upon mass-based analyses and different criteria are established for residential and commercial/industrial properties. The use of the less stringent commercial/industrial standards requires the placement of a land use restriction on the

property. The DEC is not applicable to inaccessible soils, including soil more than 1.2 meters (4 feet) below the ground surface, 0.6 meters (2 feet) below pavement greater than 7.6 centimeters (3 inches) thick, or below an existing building, provided that an Environmental Land Use Restriction (ELUR) is placed in effect for the property.

### Pollutant Mobility Criteria

The purpose of the Pollutant Mobility Criteria (PMC) is to evaluate the potential for contaminants to leach from the soil in concentrations that may degrade groundwater quality. Different numerical criteria are established for GA and GAA groundwater areas, versus GB groundwater areas. Since the site is located in a GB groundwater area, the least stringent criteria are applied for contaminants detected in the soil.

### **5.2    Results of Soil Sample Analyses**

Soil samples collected during the advancement of the Geoprobe® borings were sent to Spectrum Analytical Laboratory of Agawam, Massachusetts for laboratory analyses. Summaries of the laboratory results from the soil samples are presented in Table 1(a) to Table 1(c), which are located at the end of this report, and copies of the soil sample analytical results are included in Appendix B. The following summarizes the results of the analyses conducted on the soil samples.

VOCs were not detected in any of the soil samples. Concentrations of petroleum hydrocarbons were detected in all of the borings at concentrations ranging from Below Detection Limits (BDL) to 660 parts per million (ppm). The 0.6 to 1.2 meters (2 to 4 foot) soil samples from borings 163-1 (590 parts per million [ppm]) and 163-9 (660 ppm) contained petroleum hydrocarbons at concentrations that exceed the Residential DEC of 500 ppm. No other samples contained petroleum hydrocarbons at concentrations that exceed any applicable CTDEP RSR criteria.

PAHs were detected at varying concentrations throughout the property, and total PAH concentrations ranged from BDL to 116.8 ppm. PAHs were detected at elevated concentrations that exceed the CTDEP RSR criteria in the 163-1, 163-3, 163-5, 163-9, 163-10, and 163-12 soil samples. The 0.6 to 1.2 meter (2 to 4 foot) sample from boring 163-1 contained the compounds benzo(a)anthracene (6.6 ppm), benzo(a)pyrene (7.9 ppm), benzo(b)fluoranthene (9.9 ppm), benzo(k)fluoranthene (5.6 ppm), chrysene (8.8 ppm), dibenz(a,h)anthracene (1.4 ppm), and indeno(1,2,3-cd)pyrene (5.9 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compounds benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene were detected at concentrations that exceed their respective Commercial and Industrial DEC.

The 0 to 0.6 meter (0 to 2 foot) sample from boring 163-3 contained the compounds benzo(a)anthracene (1.4 ppm), benzo(a)pyrene (2.1 ppm), benzo(b)fluoranthene (2.7 ppm), benzo(k)fluoranthene (1.5 ppm), chrysene (1.9 ppm), and indeno(1,2,3-cd)pyrene (1.3 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compound benzo(a)pyrene was detected at a concentration that exceeds its Commercial and Industrial DEC.

The 0 to 0.6 meter (0 to 2 foot) sample from boring 163-5 contained the compounds benzo(a)anthracene (1.7 ppm), benzo(a)pyrene (2.4 ppm), benzo(b)fluoranthene (3.0 ppm), benzo(k)fluoranthene (1.5 ppm), chrysene (2.3 ppm), and indeno(1,2,3-cd)pyrene (1.8 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compound benzo(a)pyrene was detected at a concentration that exceeds its Commercial and Industrial DEC.

The 0.6 to 1.2 meter (2 to 4 foot) sample from boring 163-9 contained the compounds benzo(a)anthracene (8.4 ppm), benzo(a)pyrene (10.0 ppm), benzo(b)fluoranthene (12.0 ppm), benzo(k)fluoranthene (8.2 ppm), chrysene (11.0 ppm), dibenz(a,h)anthracene (1.4 ppm), and indeno(1,2,3-cd)pyrene (7.2 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compounds benzo(a)pyrene, benzo(b)fluoranthene, and dibenz(a,h)anthracene were detected at concentrations that exceed their respective Commercial and Industrial DEC.

The 0.6 to 1.2 meter (2 to 4 foot) sample from boring 163-10 contained the compounds benzo(a)pyrene (1.2 ppm), benzo(b)fluoranthene (1.2 ppm), and chrysene (1.2 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)pyrene and benzo(b)fluoranthene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compound benzo(a)pyrene was detected at a concentration that exceeds its Commercial and Industrial DEC.

The 0 to 0.6 meter (0 to 2 foot) sample from boring 163-12 contained the compounds benzo(a)anthracene (1.3 ppm), benzo(a)pyrene (1.1 ppm), benzo(b)fluoranthene (2.1 ppm), benzo(k)fluoranthene (2.1 ppm), chrysene (1.7 ppm), and indeno(1,2,3-cd)pyrene (1.4 ppm) at concentrations that exceed their respective GB PMC. The compounds benzo(a)anthracene, benzo(a)pyrene, benzo(b)fluoranthene, and indeno(1,2,3-cd)pyrene were also detected at concentrations that exceed their respective Residential DEC. In addition, the compound benzo(a)pyrene was detected at a concentration that exceeds its Commercial and Industrial DEC.

Varying concentrations of total arsenic, barium, cadmium, chromium, lead, and mercury were detected in the soil samples collected throughout the property. Total arsenic was detected at elevated concentrations that exceed the Residential and Commercial/Industrial DEC of 10 ppm in the 0 to 0.6 meter (0 to 2 foot) samples from borings 163-3 (11.8 ppm), 163-5 (11.9 ppm), and 163-12 (12.7 ppm); and the 0.6 to 1.2 meter (2 to 4 foot) samples from borings 163-1 (10.3 ppm) and 163-10 (10.7 ppm). In addition, total lead was detected at an elevated concentration that exceeds its Residential DEC of 500 ppm and Commercial/Industrial DEC of 1,000 ppm in the 0 to 0.6 meter (0 to 2 foot) sample collected from boring 163-12 (1,270 ppm).

Leachable lead was detected in soil samples at concentrations ranging from BDL to 0.0674 ppm. However, the concentrations detected did not exceed any applicable CTDEP RSR criteria.

### **5.3     Quality Assurance/Quality Control Samples**

The field blank (FB-1) and trip blank (TB-1) water samples did not contain detectable concentrations of contaminants. Copies of the analytical reports associated with the quality assurance/quality control samples are included in Appendix C.

## **6.0     DISCUSSION OF AFFECTED RESOURCES**

Based upon the results of laboratory analyses performed on soil samples collected as part of this Task 210 - Subsurface Site Investigation, the soil samples from the 163-1, 163-3, 163-5, 163-9, 163-10, and 163-12 boring locations contained petroleum hydrocarbon, PAH, total arsenic, and total lead contamination at concentrations that slightly exceed the GB Pollutant Mobility Criteria, Residential Direct Exposure Criteria, and Commercial/Industrial Direct Exposure Criteria. The contamination was detected in shallow soil ranging from 0 to 1.2 meters (0 to 4 feet) below the ground surface. The contaminated soil encountered at the site may affect any proposed right-of-way construction activities planned for the property.

**7.0 RECOMMENDATIONS**

Based on the results of the Task 210 – Subsurface Site Investigation performed at the 163 Connecticut Avenue property in Norwalk, Connecticut, the following items should be considered prior to the purchase and redevelopment of the site:

- Due to the soil contamination detected, material excavated from the site during any construction would require the implementation of appropriate health and safety protocols, and proper handling, stockpiling and characterization of soil prior to disposal.
- Based upon the results of the investigation, a Task 910 estimate of remedial cost is recommended for the 163 Connecticut Avenue property.

## 8.0 LIMITATIONS

All work product and reports provided by Maguire Group Inc. (MGI) in connection with the performance of this Task 210 - Subsurface Site Investigation are subject to the following limitations:

1. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based solely upon the services described therein, and not on scientific tasks or procedures beyond the scope of described services provided to ConnDOT.
2. In preparing this report, MGI has relied on certain information provided by State and local officials and information and representations made by other parties referenced therein, and on information contained in the files of State and/or local agencies made available to MGI at the time of this investigation. To the extent that such files are missing, incomplete or not provided to MGI, MGI is not responsible. Although there may have been some degree of overlap in the information provided by these various sources, MGI did not attempt to independently verify the accuracy or completeness of all information reviewed or received during the course of this investigation.
3. The conclusions and recommendations contained in this report are based in part upon the data from subsurface explorations. The nature and extent of variations between these explorations may not become evident until further explorations are completed. If variations or other latent conditions become evident, it will be necessary to re-evaluate the conclusions and recommendations of this report.
4. The water level readings made for this investigation were made at the times and conditions stated on the boring logs. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall, passage of time and other factors. Should additional data become available in the future, these data should be reviewed by MGI, and the conclusions and recommendations presented herein modified accordingly.

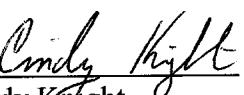

5. Where quantitative laboratory analyses have been conducted by an outside certified laboratory, MGI has relied upon the data provided, and has not conducted an independent evaluation of the reliability of these tests.
6. If the conclusions and recommendations contained in this report are based, in part, upon various types of chemical data then the conclusions and recommendations are contingent upon the validity of such data. These data have been reviewed and interpretations made in the report. It should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by MGI and the conclusions and recommendations presented herein modified accordingly.
7. Chemical analyses were performed for specific parameters during the course of this investigation, as described in the text. However, it should be noted that testing for all known chemical constituents was not performed. The conclusions and recommendations contained in this report are based only upon the chemical constituents for which testing was accomplished.

The following qualifications apply to the undersigned's opinion:

The activities described and opinions included herein are based on information gathered during this exploratory site investigation, which was limited in scope in adherence to the terms of our agreement. The professional opinion provided herein is based on the information described in this report.

The information contained herein was prepared for the use of ConnDOT solely in conjunction with the task descriptions for this assignment. The conclusions and recommendations set forth in this report are based on site conditions at the time of the investigation. Future studies and findings could change the contents of this report. The professional opinions presented in this report have been developed by using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental engineering consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional opinions included in this report.

**Laboratory Report Supplement**

**Interpretation of Total Petroleum Hydrocarbon Report**

Petroleum identification is determined by comparing the GC fingerprint obtained from the sample with a library of GC fingerprints obtained from analyses of various petroleum products. Possible match categories are as follows:

- Gasoline – includes regular, unleaded, premium, etc.
- Fuel Oil #2 – includes home heating oil, #2 fuel oil, and diesel
- Fuel Oil #4 – includes #4 fuel oil
- Fuel Oil #6 – includes #6 fuel oil and bunker "C" oil
- Motor Oil – includes virgin and waste automobile oil
- Ligroin – includes mineral spirits, petroleum naphtha, vm&p naphtha
- Aviation Fuel – includes kerosene, Jet A and JP-4
- Other Oil – includes lubricating and cutting oil, and silicon oil

Factors such as microbial degradation, weathering and solubility generally prevent specific identification within a petroleum category. A finding of "unidentified" means that the sample fingerprint was characteristic of a petroleum product, but could not be matched to a fingerprint in our library.

After identification, the amount present in the sample is quantified using a calibration curve prepared from a petroleum product of the same category as the identified petroleum. Unidentified petroleum is quantified using a petroleum calibration that approximates the distribution of compounds in the sample. A \* in the results column indicates the primary petroleum fingerprint calibration used to quantify unidentified samples. A \*\* in the results column indicates the secondary petroleum fingerprint calibration used to quantify unidentified samples. A \*\*\* in the results column indicates the tertiary petroleum fingerprint calibration used to quantify unidentified samples.
